Q: How to get UINavigationController to show the right view controller on the left side of the screen  
How can I get UINavigationController to show the right view controller on the left side of the screen. I am using a navigation controller, but I do not want to use the left pane. When I do a push segue I am getting the following: So here is my application in the debugger: Any help would be greatly appreciated.

A: You need to set the navigation stack to be the root view controller in the initial view controller. If you push a View Controller to a navigation controller, the current controller (the navigation controller) pushes the View Controller. The initial view controller is a View Controller pushed to the navigation stack. You need to set the initial view controller.

```
//For a Root View Controller MyViewController
*vController = [[MyViewController alloc]
initWithNibName:@"MyViewController" bundle:nil];
vController.title = @"My Title"; UINavigationController
*navigationController = [[UINavigationController alloc]
initWithRootViewController:vController]; //Optionally set
vController.navigationBar.tintColor [self.navigationController
pushViewController:navigationController animated:YES];
[navigationController release];
```

If you create a navigation controller and push a view controller, it has the navigation stack from the root controller.

```
//For a Root View Controller
UIViewController *vController = [[UIViewController alloc]
initWithNibName:@"MyViewController" bundle:nil];
vController.title = @"My Title"; UINavigationController
```

---

```
*navigationController = [[UINavigationController alloc]
initWithRootViewController:vController]; //Optionally set
viewController.navigationBar.tintColor [self.navigationController
pushViewController:navigationController animated:YES];
[navigationController release]; I would also set the initial view
controller when you present the view controller as you are
doing. UIViewController *viewController = [[UIViewController
alloc] initWithNibName:@"2d92ce491b"
```
