In fact, there are only two service manuals..Obstructive sleep apnea syndrome is a disease where the upper airways become closed during sleep. Sleep occurs in several stages, and each stage is characterized by a different level of consciousness and level of muscular tone. At the lowest level, deep sleep, the body muscles are relaxed, the upper airways are more widely open, and air may move through the airways freely. At this stage the rate of breathing is normally between ten and twenty breaths per minute, and the person is almost unconscious. At the second stage of sleep, called light sleep, the rate of breathing slows to around five breaths per minute. At the third stage of sleep, referred to as deep sleep, the rate of breathing slows to less than five breaths per minute. The fourth stage, referred to as REM sleep, is when the body muscles become very tight and no air can move through the upper airways. The snoring frequency increases and the lower airways may become partially or completely blocked. Obstructive sleep apnea
