A: The serial number is obfuscated in the source code for this program. In other words, it isn't just a couple of obscure hex digits; it's something that changes every time the program runs. So you're right that it's not a "serial number", though you could argue that it is one that provides a means of identifying the product. There are a lot of reasons why a product would use obfuscation to try to prevent it from being cloned. Since the program is distributed as source, it can be used to build a completely new product. This is particularly a problem

if it is intended for commercial use, as you could quite easily make money off the clone even if you distribute the new program under a different license. Obfuscation is used to make this more difficult. There are also other things that could be done to make cloning more difficult. Sometimes just making it slower would make the point. This wouldn't always be possible, but it might be possible in some cases, e.g. if you had a looping program that took a lot of time to start up. If you had a database that stored the serial number in it, this would make the problem more difficult. Another possibility would be to include "clever" code that actually slowed down the process of cloning. I think that's probably as close as anyone is going to get to a "serial number" in this case.

How to Get Started with Home Theater Projection Screens
Creating your own home theater is a luxury that most of us

want to experience at some point in our lives. A home theater is an excellent place to view movies, play games, listen to music and watch television. A home theater is essentially a highly enhanced, high-resolution TV. This allows you to watch movies in large settings and on a larger screen. Many TVs have small screen sizes and do not offer a high-resolution experience. The home theater projector allows you to enjoy a large screen or a smaller screen in a large setting. The first step to building your home theater system is to purchase the necessary components. The projector, receiver and speakers are the most important parts of the system. The receiver, while helpful, is

A: I've figured it out. It's a serial number error. This motherboard was sold in the US. The serial number used on the box was wrong. It should be 200906430 instead of 200920803. It looks like it was altered by the packer.

Fetal gene therapy: promise and problems. There are two major advances in the field of gene therapy for inherited diseases: the first is the rapid development of efficient gene transfer vectors, the second is the application of those vectors to the fetal, perinatal, and neonatal stages of human development. As these two advances are brought together, the field of gene therapy will move from "promise" to "reality." This paper explores the ability of these vectors to transduce and deliver genes to the fetus and neonate, the potential benefits of gene therapy in prenatal and postnatal gene therapy, and the implications of fetal gene therapy for long-term future studies of the genetic basis of diseases and genetic counseling.

Q: How can I store a function into a class property? Can anyone tell me how to store a function into a class property? My code is listed below:

```
class Students { public $average_grade; public function __construct() { $this->average_grade = function( $average_grade = 5 ) { return $average_grade * 2; }; } } $student1 = new Students(); $average_grade = $student1->average_grade; echo $average_grade; // It prints 5
```

A: If you want to store a function you should return that function. Like this:

```
class Students { public $average_grade; public function __construct() { $this->average_grade = function( $average_grade = 5 ) { return $average_grade * 2; }; } public function getAverage() { return $this->average_grade; } }
```
