Mindshift expands offerings, expands family - blasdel ===== blasdel I'd like to know if there's any industry that still employs people who were retained by personal recommendations from the company founder. It's so incredibly rare to find someone who's still around that it's nearly impossible to know when they are still around, much less who they are. ----- tdavis As a young up and comer, I can't help but be disappointed at the engineering choices made by IBM. The whole "whatever we make happens to look and work like Windows" is pretty backwards thinking and prevents innovation in a field where no one gives a damn about Windows at all. It's a tragedy that any company can't see that their best engineers are the ones who can iterate and adapt past whatever it is they're already working on and create better solutions. What a joke. ---- mechanical_fish I'm surprised to hear you say that; the current stable of IBM microprocessors seem to be a very attractive family of microprocessors, and the pattern that has emerged over the years, in particular, is that new designs do not look like old designs. People are always jumping on the latest microprocessor as soon as it is available, but it generally happens to be a very functional design. Has there been a long string of failed hardware designs from IBM? I can't think of anything offhand, but I'm sure they've done plenty of those. ---- tdavis I don't think you could say it's a "family" though. All the recent efforts have
