A program that is designed to be used to count lines of code (LoC) at the file or function level. When counting at the function level, it also computes McCabe's cyclomatic complexity and the level of nesting inside the function. Counting at file level When used for this purpose, it gives the number of code lines, code and comment lines, commment lines and blank lines in the file. It supports the following file types: Java, C++, VB, SQL, HTML, JSP. When counting for HTML or JSP files, it will count LoC correctly for javascript and vbscript code embedded within the tag. Counting can be done for a single file or a directory (with the option of recursively counting within sub-directories). The values are written to a.csv file so that it can be

opened and analyzed using Excel. This functionality is invoked when the Count LoC button is pressed after selecting a file or directory. Counting at function level This can be done for the filetypes - C++, Java and VB. In additional to giving LoC at function level, it also gives the Cyclomatic Complexity of the function and the nesting level within the function. For an explanation of Cyclomatic complexity, please see the document on Structured Testing that can be downloaded from this page. Function level counting is invoked when the Count Detail button is pressed after selecting a file or directory. A: It's not a code analyzer, but CyLines is a nice little GUI application.
