Adobe Photoshop This series of tutorials will teach you how to create simple vector illustrations and how to make simple to complex photoshop artwork that can be used for brochures, posters, flyers, logos and branding. I will walk you through my favorite techniques used in creating this artwork. This series will teach you to create a large number of professional looking images that take shape very quickly. I have a photographic background and have used Photoshop for years. I hope that this series is as useful for you as it is for me. Progression of Photoshop I'm planning on showing you how to create these in Photoshop CS 5.5, however, some of the tips and techniques may be applicable in older versions as well. Step 1 — Creating a Vector Head Looking for a quick and easy way to get your head shape into Photoshop without going through a lot of intermediate steps? Yes, this is that quick and easy way. Step 2 — Background with a Gradient You can use a gradient for any background, including faces. I use this technique a lot to set the background and add a nice ambient glow to the artwork. Step 3 — Creating a New File Create a new file for a new Illustrator document or create a new Photoshop file. It does not matter which one you create. Step 4 — Creating a New Layer Use the New Layer button on the Layers palette to create a new layer and place the head shape on it. Step 5 — Adjusting the Head Shape Use the Live Filter to make adjustments to the shape of the head. This is how I created the "glowy" texture on the head. Step 6 — Reducing Noise While reducing the noise in the background, I find that I generally need to bring down the noise in the head shape and in the eyes. Step 7 — Exploring the Brush You can use any of the brush tools (e.g. Round, Bumpy, Cookie, etc.) to create textures and get the desired look you desire. Step 8 — Quickly Creating Wireframe Mesh Quickly create a wireframe mesh using the Polylobe tool found on the Home tab of the toolbar. Step 9 — Creating a Shadow Use the pen tool to create an ellipse shape on the layer. Use the bottom of the face shape as

Q: How to recursively remove all references from my code I'd like to clean up my old vhdl code and I'm looking for a tool which can recursively remove all references to other files. Problem is, I have a large collection of reference files like: my_module.vhd - references module my_sub_module.vhd - references module sub_module.vhd - references module I want to get all references out of it and remove it all together. I'm using xilinx VHDL compiler. So far the best approach I found was to: remove the *.vhd and *.lib files delete the generated *.model file remove all references with htasm, but what I don't like is that the compiled code of my_sub_module.vhd isn't cleaned up and just exists in the project folder. If I delete all *.vhd files and remove the references to module in my_sub_module.vhd, an error is reported: "Cannot write model: Model directory out of date. It will be considered to be the current snapshot. The latest snapshot is stored in a new location '~/snapshots/other_lib.vhd'" A: I found out that it is possible with a xilinx command line tool called htasm. The -e option allows you to specify the path to the directory in the code's workspace where the files need to be deleted. htasm -e "cd(myproject.path)/sub_module; htasm -e 'cleanup' -f uurml.cfg -project=myproject_vhdl -mode=noshigh" The error about the outdated model files is gone. Now all references to the remaining files are removed and the model file is removed. htasm -e "cd(myproject.path)/sub_module; htasm -e 'cleanup' -f uurml.cfg -project=myproject_vhdl -mode=noshigh" htasm -e "cd(myproject.path)/my_sub_module; htasm -e 'cleanup' -f uurml.cfg -project=myproject_vhdl -mode=noshigh" htasm -e "cd(my

Q: Origin of a rose? What is the origin of the word 'rose'? Is it plant or flower? If it is a plant, then can it be a living plant or there is no way a plant can generate its own oxygen? If it is flower, then I can understand it is a flower and there is no trouble with oxygen. A: As explained on etymology.com: As a noun, meaning "a rose," the word is first recorded in English in Anglo-Saxon times (to ca. 1150). The word is recorded as ros (plural roses) in the Exeter Book, a 12th-century Anglo-Saxon manuscript. The word is also recorded in Middle English, in the form of an adjective rose in Old English. The word rose is first found in Old English as a feminine noun, and in Middle English as a masculine noun. However, "rose" does not necessarily have to be related to a flower. The word is etymologically related to "a bouquet of roses." It is also related to the verb "to rain roses." It is also very common to describe a blooming flower with the adjective "rosy." Personally, I would use "rose" to refer to "a rose," "a bouquet of roses," and "a rose blossom." But I don't think there is a single, correct meaning. A: I'm not sure what you are asking. I would suggest that whether "rose" is an adjective or noun, it was originally a word referring to the flower itself and its scent. It is first recorded in English in Anglo-Saxon times, (to ca. 1150). The word is recorded as ross in the Exeter Book, a 12th-century Anglo-Saxon manuscript. The word rose is first found in Old English as an adjective rose (Old Norse rosr), and in Middle English it is a feminine noun. If it refers to the flower, then as the earlier Oxford Dictionaries Online says, it is: Origin Middle English rose (adj.), from Old English ros (pl. rosses) 'a rosebush, rose'. The OED also seems to suggest that it is a noun. A: Yes,
